

This summer in Beijing:

Swiss Securitas at the House of Switzerland

Welcome to a region of Switzerland worth visiting at the Olympic Games 2008! The Swiss Securitas Group looks forward to receiving you at the House of Switzerland in Beijing in August 2008. It would be a great pleasure for us to offer you a warm welcome and to ensure your security.

The Swiss Securitas Group is the official partner for the House of Switzerland and is responsible for its security systems and safe operations. This project represents a milestone on the road to introducing our products and services to the Asian and especially Chinese markets. Our security systems and services have an excellent reputation in the world market.

Security as a foundation. Irrespective of whether private, business or public security requirements, they all are focussed on an incident- and care-free life. The Swiss Securitas Group is here to care about your security needs and to give you the freedom to focus on what are your important things in life.

Portrait:

«People and technology acting together for your security.»

Meeting security and protection needs with human capabilities, technical system solutions and efficient services provides the foundation for the success of the Swiss Securitas Group.

From this versatility we generate synergies and are constantly developing and refining our products and services. Our philosophy and market activities are directed towards effective security.

Our security promise: With the Swiss Securitas Group you are in the right hands, because we call up the best solution for each requirement. Thanks to this commitment, the knowhow of the Group has always grown to meet our customers' expectations – and what is more, has kept one step ahead of the risks.

A decisive advantage of the Swiss Securitas Group is its experience. It has been dealing with the subject of security since 1907. Today over 10'000 employees provide professional services and leading security technology – worldwide.

Security from a single source, the efficiency of the right size of partner, and closeness to the market, both technically and geographically, characterise the Group companies. No security requirement is too complex – and none too small – to justify anything but the best possible protection against risks. The subsidiaries and affiliated companies of the Swiss Securitas Group are devoted to this principle – and above all to your security.

Alarm and Security Systems Business Area:

«Effective security systems – thanks to leading technologies.»

Best technical solutions originate from the Alarm and Security Systems business area of The Swiss Securitas Group. At the same time, human beings stand at the centre, for they make available the technology, which in turn makes human beings safer – from the sensible detection of single events through complex Security Management Systems. In conjunction with design, development, planning, installation and maintenance, professional security emerges.

Intrusion and hold-up detection. Protection against intrusion takes into account the individual threat as well as building and organisational aspects. Therefore the systems for reporting break-ins and robberies are orientated to the respective requirements, efficient operability and the latest state of technological development.

Fire detection. In addition to leading fire-detection technology for standard applications, the technical companies of the Securitas Group have available great know-how for special fire detection systems. Tailormade solutions provide protection against fire damage, even under adverse environmental and room conditions.

Access control. Electronic access control systems give easy access to authorised people and keep out undesirables. Electronic badges, biometric procedures – such as automatic recognition of the iris pattern or the fingerprint – serve for identification. Time recording and emergency control systems complement the system capabilities. People, property and knowledge in the operation are protected.

Video surveillance. Rapid technological development sets the pace in video technology, image evaluation and storage. This makes it possible to set up effective security, surveillance and control systems. Whether the need is for sophisticated high-security systems or private surveillance schemes, experienced specialists recommend suitable components in conformity with technical and legal standards.

Security management systems. Security and building technologies allow operational control and comprehensive monitoring of modern buildings. Security control centres are ideal for designing all sub-areas to be userfriendly and easily monitored. Professional integration of all sub-systems and a security control centre form the efficient basis for controlling all installations centrally and exploiting synergies.

Property protection. A mobile, modular surveillance system increases the efficiency of security staff in the surveillance of sites and buildings. It is suited to the needs of army, police, border-control force and civil protection. A variant of the system has proved its worth as a central security tool for major events, which rely on maximum protection during a short period.

Hospital communication systems. The multi-functional patient terminal allows the best and most rapid contact possible between patients and nursing staff. As an intelligent communication and accounting system, it also reduces administrative costs.

Fire-fighting. Fixed sprinkler, foam and gas extinguisher systems, together with small extinguishers, protect life and avoid fire damage from the start. Effective fire protection begins with planning by professional installers, who offer effective and economical solutions for systems of all sizes.

Security Services Business Area:

«The leading range of security services.»

The Security Services business area represents the human being in action. His performance and ability to react, his communication and judgement skills, make him the key figure for security. The service companies of The Swiss Securitas Group offer complete solutions for every security requirement.

Surveillance duties. On their rounds in buildings and sites, guards ensure security and respond to irregularities. A modern guard concept also includes control of the security technology in addition to operational and production-related checks. The observant surveillance specialists are highly trained, supported by operations centres and ensure quality in order to prevent potential damage.

Event services. Security-related planning, coordination and staging of events of all sizes and types is in good hands with us. When it comes to access checks, maintaining order, guarding, traffic control and escorting visitors, our security staff play a decisive role. They support the public's sense of security and the success of the event.

Security services. However an increased threat is expressed, public-order teams, building guards or armed executive protection provide highly qualified security. Thanks to excellent training and wide experience, they protect both people and property.

Traffic services. How important mobility is in everyday life becomes evident when it does not function. Traffic-service staff ensure better traffic flow on roads, fair treatment in parking areas and security at railway construction sites.

Intervention and control-centre services. Professional security means reacting rapidly at any time. Intervention teams guarantee this readiness. 24-hour operations centres take on rapid-response tasks and secure back-up for uniformed staff in action.

Investigation services. Specialists are employed for identifying symptoms of violence at major events and for investigations in the area of insurance abuse or suspicious circumstances relating to employment law. In cases of suspicion they seek to provide solid proof.

Document and data-carrier destruction. Discreet and secure destruction of confidential documents or data is of relevance for security technology. Experts in secure disposal ensure the collection, transport, destruction and recycling of the sensitive material.

Alarm reception. Professional alarm centres form the hub of security information. They process reports from alarm and monitoring systems and call in intervention forces.

Risk management. Complex security requirements demand a broadly-based approach to the solution. Our specialists record and assess risks, work out security concepts and put these into practice.
